Ultimate and proximate analysis of coal before ultra-low emission upgrading are shown in Table 6.6, and mercury content in coal, ash, slag, limestone, and gypsum is shown in Table 6.7. The data show that the mercury content in coal was 49 ug/kg. Compared with the Chinese coal in literature [34], it is found to belong to low mercury content coal. After combustion, mercury was enriched in fly ash particles, and the mercury content in fly ash was about twice as much as that in coal.
